How to Use the Exercise Files and Data Files

1. You can attempt all of the exercises without the provided workflows. Since the workflows are not complex and we will only attempt a few steps in each video, you can start with an empty workflow.

2. The workflows are always offered as the final state at the end of each chapter, so they can be useful for checking your work.

3. You will need the data files. The exercises won't be possible without them.

4. There are two methods for ensuring that the data files will be located properly.

5. Check the path each time by browsing for the file location in the File Reader node (or other input node).

6. Change the workspace preferences to always look for files in the folder where you've placed the data files.

7. If you choose to upload the workflows, you should understand what the KNIME file extensions mean. A .knwf file is a single workflow, and a .knar file is a workflow group.

8. In KNIME, go to **File > Import KNIME Workflow**. Browse for the .knar file, and you will be able to import all of the workflows in one step.
